## **ASSESSMENT TOOL 1**

**COURSE NAME: OPERATING SYSTEMS**

**COURSE CODE: CSA04**

---

### **COURSE OUTCOME COVERED**

**CO2:** Analyze process management and deadlock handling techniques to improve CPU utilization and system performance(BL3-BL4)

*Assessment Tool Weightage: 40%*

---

**QUESTIONS: 10**

**Total Marks:100**

Annexure A

Analytical Problem Solving

---

### **Code of Conduct:**

*I ~~Prasanna~~ ~~Shrini~~ ~~KS~~ (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment.*

*I understand that any violation of academic integrity rules will result in disciplinary action.*

### Question 1: CPU Scheduling – Waiting Time & Turnaround Time Analysis

A set of processes arrive at time 0 with the following burst times:

Process      Burst Time (ms)

|    |    |
|----|----|
| P1 | 10 |
| P2 | 4  |
| P3 | 6  |
| P4 | 2  |

- Calculate Waiting Time and Turnaround Time for each process using SJF (Non-preemptive).
- Compute the average waiting time and average turnaround time.
- Interpret whether SJF improves CPU utilization compared to FCFS for this workload.

(10 Marks)

### Question 2: Round Robin Scheduling – Time Quantum Impact

Consider the following processes:

Process      Burst Time (ms)

|    |    |
|----|----|
| P1 | 20 |
| P2 | 5  |
| P3 | 13 |
| P4 | 8  |

Let the time quantum = 4 ms.

- Construct the Gantt chart for Round Robin.
- Calculate Waiting Time and Turnaround Time of each process.
- Analyze how changing the quantum to 10 ms would affect system performance (CPU utilization & context switching).

(10 Marks)

### Question 3: Deadlock – Safety Check Using Banker's Algorithm

A system has 3 resource types (A, B, C). Total resources:  
A = 10, B = 5, C = 7.

The Allocation and Maximum Need matrices are:

Allocation Matrix

| Process | A | B | C |
|---------|---|---|---|
| P1      | 0 | 1 | 0 |
| P2      | 2 | 0 | 0 |
| P3      | 3 | 0 | 2 |
| P4      | 2 | 1 | 1 |
| P5      | 0 | 0 | 2 |

Maximum Matrix

| Process | A | B | C |
|---------|---|---|---|
| P1      | 7 | 5 | 3 |
| P2      | 3 | 2 | 2 |
| P3      | 9 | 0 | 2 |
| P4      | 4 | 2 | 2 |
| P5      | 5 | 3 | 3 |

- Calculate the Need Matrix.
- Determine if the system is in a safe state using Banker's Algorithm.
- Provide a valid safe sequence if it exists.

(10 Marks)

### Question 4: Deadlock Detection – Resource Allocation Graph (RAG)

A system has the following resource allocations:

- P1 is holding R1 and waiting for R2
- P2 is holding R2 and waiting for R3

- P3 is holding R3 and waiting for R1

- Draw the Resource Allocation Graph (describe in text).
- Determine whether the system is in deadlock.
- Recommend a strategy (prevention OR avoidance OR recovery) to resolve it and justify the method.

(10 Marks)

### Question 5: CPU Utilization – Multiprogramming Level Analysis

A system has the following process behavior:

- Each process spends 20% time in CPU and 80% waiting for I/O.
- Degree of multiprogramming = 4 processes

CPU Utilization formula:

$$U = 1 - (p^n)$$

where:

- $p$  = probability a process is waiting for I/O,
- $n$  = number of processes in memory

- Calculate CPU Utilization.
- Compute CPU utilization if the degree of multiprogramming increases to 6.
- Interpret which configuration improves system performance and why.

(10 Marks)

### Question 6: Producer–Consumer Problem Using Semaphores

A bounded buffer has a capacity of 6 items. Initially, the buffer is empty. Three producer operations occur followed by two consumer operations.

- Show the values of the semaphores (empty, full, mutex) after each operation.
- Explain how semaphores prevent race conditions.
- What problem occurs if the mutex semaphore is removed? Justify your answer.

(10 Marks)

### **Question 7: Process Synchronization – Critical Section**

Two processes increment a shared variable X initially equal to 100. Each process executes the increment operation 1000 times without synchronization.

- Explain how a race condition occurs.
- Determine the expected value of X with proper synchronization.
- Suggest one hardware-based and one software-based synchronization solution.

**(10 Marks)**

### **Question 8: Thread Scheduling and Performance**

A program creates 40 user-level threads on a system having 8 CPU cores. Each thread requires 12 ms CPU time and performs negligible I/O.

- Compare the Many-to-One and One-to-One multithreading models.
- Estimate how CPU utilisation differs between the two models.
- Recommend the better threading model with justification.

**(10 Marks)**

### **Question 9: Monitor Synchronization**

A monitor controls access to a shared printer used by multiple processes.

- Explain how monitors ensure mutual exclusion.
- Describe the role of condition variables `wait()` and `signal()`.
- Explain what may happen if `signal()` is omitted after a print job completes.

**(10 Marks)**

### **Question 10: Deadlock Prevention vs Avoidance**

A system has four processes competing for two reusable resources.

- Explain how deadlock prevention can eliminate one of the four necessary conditions for deadlock.
- Using a suitable example, explain how deadlock avoidance differs from prevention.
- Compare prevention and avoidance in terms of resource utilisation and system performance.

**(10 Marks)**

### RUBRICS FOR CALCULATION: Analytical Problem Solving

| Criteria                  | Weightage | Level 4<br>(Exemplary)                                                            | Level 3<br>(Proficient)                   | Level 2<br>(Developing)                    | Level 1<br>(Beginning)                        |
|---------------------------|-----------|-----------------------------------------------------------------------------------|-------------------------------------------|--------------------------------------------|-----------------------------------------------|
| Problem Understanding     | 20%       | Clearly interprets problem, identifies all parameters and requirements accurately | Understands problem with minor gaps       | Partial understanding; misses key elements | Misinterprets or unable to understand problem |
| Method Selection          | 20%       | Selects most appropriate method/formula with strong justification                 | Selects correct method with minor errors  | Inappropriate or partially correct method  | Unable to select method                       |
| Solution Process          | 25%       | Logical, systematic steps with correct approach throughout                        | Mostly correct steps with minor mistakes  | Disorganized steps; multiple errors        | No clear process                              |
| Accuracy of Calculation   | 20%       | All calculations accurate; correct final answer                                   | Minor calculation errors                  | Frequent errors; incorrect final answer    | No valid calculations                         |
| Interpretation of Results | 15%       | Clearly interprets results with units and engineering relevance                   | Basic interpretation with minor omissions | Limited or unclear interpretation          | No interpretation                             |

#### Marks Evaluation:

| Question No. | Problem Understanding (20%) | Method Selection (20%) | Solution Process (25%) | Accuracy of Calculation (20%) | Interpretation of Results (15%) | Total Marks (100) |
|--------------|-----------------------------|------------------------|------------------------|-------------------------------|---------------------------------|-------------------|
| Q1           |                             |                        |                        |                               |                                 |                   |
| Q2           |                             |                        |                        |                               |                                 |                   |
| Q3           |                             |                        |                        |                               |                                 |                   |
| Q4           |                             |                        |                        |                               |                                 |                   |
| Q5           |                             |                        |                        |                               |                                 |                   |
| Q6           |                             |                        |                        |                               |                                 |                   |

Name : Priyadarshini

Reg : 192511248

Sub : CSA0404

Code : Operating Systems

CPU Scheduling - waiting time & Turnaround Time :

| Process | Burst time |
|---------|------------|
| P1      | 10         |
| P2      | 4          |
| P3      | 6          |
| P4      | 2          |

a) Non-preemptive Shortest Job First (SJF) is CPU scheduling algorithm that selects process with smallest burst time first. It minimizes average waiting time and turnaround time.

Gantt chart :

|    |    |    |    |    |
|----|----|----|----|----|
| P4 | P2 | P3 | P1 |    |
| 0  | 2  | 6  | 12 | 22 |

waiting time :

$$WT = \text{Start Time} - \text{Arrival Time}$$

| Process | Start Time | Waiting Time |
|---------|------------|--------------|
| P4      | 0          | 0            |
| P2      | 2          | 2            |
| P3      | 6          | 6            |
| P1      | 12         | 12           |

Turnaround time :

$$TAT = \text{Completion time} - \text{Arrival Time}$$

| Process | TAT |
|---------|-----|
| P4      | 2   |
| P2      | 6   |
| P3      | 12  |
| P1      | 22  |

b) Average :

$$\text{Average waiting time} : \frac{0+2+6+12}{4} = \frac{20}{4} = 5 \text{ms}$$

$$\text{Average TAT} : \frac{2+6+12+22}{4} = \frac{42}{4} = 10.5$$

c) Interpretation :

SJF schedules shortest process first, reducing waiting time of smaller jobs.

2) Round Robin Scheduling - Time Quantum :

| Process | Burst Time |
|---------|------------|
| P1      | 20         |
| P2      | 5          |
| P3      | 13         |
| P4      | 8          |

chart

P2 | P3 | P4 | P1 | P2 | P3 | P4 | P1 | P3 | P1 | P3 | P1  
8 12 16 20 21 25 29 33 37 38 41 45

$\pm$  Completion Time - Arrival Time

→ 46

→ 21

→ 42

→ 29

P4

Average TAT :  $\frac{138}{4} = 34.5 \text{ ms}$

WT = TAT - Burst Time

P1 → 26

P2 → 16

P3 → 29

P4 → 21

Average WT =  $\frac{92}{4} = 23 \text{ ms}$

Effect of Increasing Time Quantum to 10 ms:  
Number of context switches decreases  
CPU spends less time  
CPU utilization improves.

### 3) Deadlock - Safety check using Banker's Algorithm

a) Need Matrix:

$$\text{Need} = \text{Maximum} - \text{Allocation}$$

$$P_1 \rightarrow 7 \ 4 \ 3$$

$$P_2 \rightarrow 1 \ 2 \ 2$$

$$P_3 \rightarrow 6 \ 0 \ 0$$

$$P_4 \rightarrow 2 \ 1 \ 1$$

$$P_5 \rightarrow 5 \ 3 \ 1$$

b) Safe state check:

$$\text{Available} = 3 \ 3 \ 2$$

$$P_2 : 1 \ 2 \ 2 \leq 3 \ 3 \ 2$$

$$P_4 : 2 \ 1 \ 1$$

$$P_1 : 7 \ 5 \ 5$$

Since all process complete successfully  
System is in a safe state.

c) Safe sequence:

$$P_2 \rightarrow P_4 \rightarrow P_5 \rightarrow P_1 \rightarrow P_3$$

### 4) Deadlock Detection - Resource Allocation:

a) Resource Allocation:

$P_1$  holds  $R_1$  & waits for  $R_2$

$P_2$  holds  $R_2$  & waits for  $R_3$

$P_3$  holds  $R_3$  & waits for  $R_1$

Representation:

Agg

$R_1 \rightarrow P_1$

$P_1 \rightarrow R_2$

$R_2 \rightarrow P_2$

$P_2 \rightarrow R_3$

$R_3 \rightarrow P_3$

$P_3 \rightarrow R_1$

$P_1 \rightarrow R_2 \rightarrow P_2 \rightarrow R_3 \rightarrow P_3 \rightarrow R_1 \rightarrow P_1$

b) Deadlock Detection:

Resource Allocation Graph contains a cycle & each resource has single instance.

c) strategy

one process terminated or its allocated resource  $R_3$  can be preempted.

5) CPU utilization - Multiprogramming level:

CPU utilization is percentage of time CPU is actively executing processes instead remaining idle.

Probability = 0.8

Degree = 4

Formula  $\Rightarrow U = 1 - p^n$

a) Calculate CPU utilization for  $n=6$

$$U = 1 - (0.8)^6$$

$$U = 1 - 0.262144$$

$$U = 0.737856$$

CPU utilization = 73.79%

b) Calculate CPU utilization for  $n=4$

$$U = 1 - (0.8)^4$$

$$U = 1 - 0.4096$$

$$U = 0.5904$$

CPU utilization = 59.04%

c) Interpretation:

\* For 4 process, CPU utilization is 59.04%

\* For 6 process, 73.79%

\* 6 processors provide better system performance.

b) Producer - Consumer Problem

Synchronization

problem where producer add items to shared buffer & consumers remove items from it.

performance :

| Semaphore values after each operation : |       |      |       |
|-----------------------------------------|-------|------|-------|
| operation                               | Empty | Full | Mutex |
| Initial state                           | 6     | 0    | 1     |
| producer 1                              | 5     | 1    | 1     |
| producer 2                              | 4     | 2    | 1     |
| producer 3                              | 3     | 3    | 1     |
| Consumer 1                              | 4     | 2    | 1     |
| Consumer 2                              | 5     | 1    | 1     |

b) How semaphores prevent race conditions :

\* Mutex semaphore allows only one process to access shared buffer at time.

\* Empty semaphore keeps track of available empty slots in buffer.

\* Full semaphore keeps track of filled slots available for consumers.

c) Effect of removing mutex semaphore :

If mutex semaphore is removed :

\* Producers & consumers may access buffer simultaneously.

\* Multiple processes can modify same buffer location at same time.

7) Process Synchronization:

Critical section is a part of program where shared resource is accessed.

a) Explain how a race condition occurs:

Shared variable  $X = 100$ .

Two process increment  $X$  1000 times

each.

b) Expected value of  $X$ !

Initial value  $X = 100$

Process 1 increments  $X$  1000 times

Process 2 increments  $X$  1000 times.

Total increments  $= 2000$

Final value of  $X = 100 + 2000 = 2100$ .

c) Synchronization solution:

Hardware Based:

Software Based:

TSC / CAS

Mutex lock

## Thread Scheduling & Performance:

San multiple threads within a single process.

a) Many to one                      one to one

many user threads                      Each user thread is  
are mapped to one kernel thread.                      mapped to separate  
kernel thread.

Blocking of 1 thread                      One blocked thread  
blocks all others.                      doesn't affect other.

b) CPU utilization comparison:

Ans. No. of user-level threads = 40

CPU cores = 8

CPU time per thread = 12ms

Many to one:

CPU cores are underutilized

CPU utilization is lower because

one to one:

threads are distributed all 8 CPU cores

c) Recommended:

one-to-one multithreading model

It supports true parallelism.

Provides better CPU utilization.

a) Monitor synchronization:  
Monitor is a high-level synchronization mechanism that controls access to shared resources.

a) How Monitors ensure mutual exclusion,  
Monitor contains shared data & procedures that operate on data. This prevents simultaneous access to shared resources.

b) Role of wait() & signal()  
wait() → when a process cannot continue it calls wait().  
signal() → when a resource becomes available, process calls signal().

c) Effect of omitting signal():  
If signal() is not called after a print job completes, waiting process remain blocked, Printer may become idle lead to underutilisation.

# Deadlock prevention vs Deadlock Avoidance

## a) Deadlock prevention:

Deadlock prevention avoids deadlocks by eliminating one of four necessary conditions of deadlock.

## b) Deadlock Avoidance:

It allows resource requests only if system remains in safe state.

thus, avoidance prevents deadlocks by making safe allocation decisions.

## c) Comparison:

Deadlock prevention  
Eliminates one of condition

Simpler to implement  
Lower resource utilization.

May reduce system performance

## Deadlock Avoidance

Checks for a safe state.

More complex

Better.

Improves
